

Increasing brain capacity; just drink.

A herd of bison always keep in hierarchical formats, keeping the slowest and weakest at the back in case of predators. This helps if there is an attack; the bison which are the most important to the herd will stay alive and continue helping the herd flourish and develop than be dragged down by the weak ones. This is natural selection at its finest but it is not only bison which are biologically set to function this way...your brain is too.

Your brain consists of many brain cells which help you do your daily routines and allow you to function as a human being. Some cells are weaker than others and are more susceptible to dying out from diseases and bumps such as trips down stairs (ahem) and other accidents.

Alcohols over time, if taken in large quantities will start killing the weaker cells off leaving the person with the strongest brain cells. This in the end allows us to function at a 100% capacity without the slowdown of the weak cells. So in conclusion; alcohol increases brain capacity and allows for the user to do their tasks without slowdown.

That is also the reason you feel more of a smartass when alcohol is in your system.
